Score	17.5 / 64 (27.34%)	**Flagged items**	0	**Actions**	0

Site Name

WSPT Central

Western Sydney Parklands,
Wallgrove Rd, Eastern Creek NSW
2766, Australia
(-33.7867788, 150.870611)

Conducted on	10 Apr 2026 15:01 AEST
Prepared by/ Supervisor	Daniel Goodfellow

Inspection	16.5 / 63 (26.19%)
Weather Comments e.g Hot, Windy, Rain	Cloudy, windy,
Personel Onsite	3 / 13 (23.08%)

Staff/Contractors

Dan Goodfelow	Ethan Magtoto	Samantha Klein

Total Worked Hours	24
Staff worked hours (individual)	8
Remaining Hours	N/A
Work Onsite	5 / 35 (14.29%)

Tasks Undertaken

Cut & Painting	Chainsawing	Brushcutting

Details Of Tasks

Daily Site Report – Zone 56

At the beginning of the day, the team implemented standard site hygiene procedures to minimise the risk of spreading soil-borne diseases between work areas. All team members sprayed their boots as well as the vehicle wheels with a methylated spirits solution mixed at a 70/30 ratio with water. This preventative measure is an important biosecurity practice used to reduce the possibility of transferring contaminated soil or plant pathogens across the site.

Following the hygiene procedures, the team leader assessed the work plan for the day and decided that operations would continue in Zone 56. This area has been the focus of ongoing weed control activities, and continuing work there allows the team to build on previous treatments and further improve site accessibility and weed suppression.

During the day, two team members focused on brush cutting previously sprayed lantana. The lantana had been chemically treated during earlier works and had since died back, making it suitable for mechanical reduction. Using brush cutters, the team mulched the dead lantana down to ground level. This work significantly improved the visual presentation of the site and reduced the amount of dead standing and fallen vegetation. In addition, mulching the material created better access paths into dense patches of vegetation, allowing the team to move more easily through the area and prepare it for further weed control activities in sections where lantana and other invasive species are still present.

At the same time, one team member continued cut-and-paint control of larger African olive trees located throughout dense patches of regrowth. Using a chainsaw, the operator cut the trunks of mature African olive trees close to ground level. Immediately after cutting, glyphosate herbicide was applied directly to the exposed stump surface. This technique ensures the herbicide is absorbed into the plant’s vascular system, effectively preventing regrowth from the stump and root system.

As part of this work, the team member also dragged the cut African olive material away from the work area and piled the branches and trunks on site. Consolidating the cut vegetation into piles helps keep the work zone clear, improves site safety by reducing trip hazards, and allows easier access to surrounding areas for continued weed control. Piling the material also assists with site organisation and visual improvement by keeping debris contained rather than scattered throughout the treatment area.
Throughout the day, the team made steady progress through the dense vegetation in Zone 56 using a

combination of mechanical and chemical control methods. Brush cutting of previously treated lantana improved access and site presentation, while the ongoing cut-and-paint treatment targeted larger woody weeds such as African olive that require more intensive management.

Overall, the day's work contributed to the gradual reduction of invasive species within the zone, improved site accessibility, and supported the broader ecological restoration goals for the area. Continued follow-up work in this zone will help ensure effective long-term control of lantana and African olive while encouraging native vegetation recovery.

Weeds Targeted

	Lantana	African Olive

Other Weeds

Rough percentage of weeds removed (within the zones worked in)	95%

Site Area Work Map

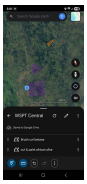

Photo 1

Details of Mapped Areas or Description of Areas Worked

Purple - Brushcut - Lantana
Orange - Cut & Paint - African Olive

Chemicals Used	1 / 7 (14.29%)
Herbicide	Glyphosate
Total Sprayed (L) and Mix used (ml/L)	500ml
Priorities	2 / 2 (100%)
New observed fauna?	No
New observed flora?	No
